

**IN THE CLAIMS:**

Please amend the claims as follows:

1. (Cancelled)
2. (Previously Presented) The method of claim 31, wherein at least one of the first and second units of work is a query.
3. (Previously Presented) The method of claim 31, wherein at least one of the first and second units of work is an analysis routine.
4. (Previously Presented) The method of claim 31, further comprising displaying the returned first and second sets of user-selectable scheduling options via a menu in the user interface.
5. (Previously Presented) The method of claim 31, further comprising, for each of the first and second sets of user-selectable scheduling options:
  - receiving a user selection from the respective set of user-selectable scheduling options; and
  - storing a schedule for the respective unit of work on the basis of the user selection.
6. (Previously Presented) The method of claim 31, further comprising, for each of the first and second sets of user-selectable scheduling options:
  - receiving a user selection from the respective set of user selectable scheduling options;
  - storing a schedule for the respective unit of work on the basis of the user selection; and
  - repetitively executing the respective unit of work on the basis of the schedule.

7. (Previously Presented) The method of claim 31, wherein determining the first and second costs to execute the first and second units of work, respectively, comprises estimating a respective time required to execute the respective unit of work.
8. (Previously Presented) The method of claim 31, wherein determining the first and second costs to execute the first and second units of work is done on the basis of historical query execution times for previous executions of the respective units of work.
9. (Cancelled)
10. (Previously Presented) The method of claim 31, wherein determining the first and second sets of user-selectable scheduling options comprises:
  - determining user parameters specific to a user; and
  - determining the respective set of user-selectable scheduling options for future execution of the respective unit of work on the basis of the respective cost and the user parameters.
11. (Original) The method of claim 10, wherein the user parameters include at least one of a user status of the user and other units of work already scheduled for execution by the user.
12. (Cancelled)
13. (Currently Amended) The method of claim ~~[[32]]~~33, wherein determining system availability to execute the first and second units of work, respectively, comprises accessing a query schedule having entries defined for respective units of work.
14. (Currently Amended) The method of claim ~~[[32]]~~33, further comprising, for each of the first and second sets of user-selectable scheduling options:
  - receiving a user selection from the respective set of user selectable scheduling options;
  - storing a schedule for the respective unit of work on the basis of the user selection; and

repetitively executing the respective unit of work on the basis of the schedule.

15. (Currently Amended) The method of claim ~~[[32]]~~33, wherein determining the first and second costs to execute the first and second units of work comprises estimating a respective time required to execute the respective unit of work.

16. (Currently Amended) The method of claim ~~[[32]]~~33, wherein determining the first and second costs to execute the first and second units of work is done on the basis of historical query execution times for previous executions of the respective unit of work.

17-18. (Cancelled)

19. (Currently Amended) The computer readable storage medium of claim ~~[[33]]~~35, wherein determining the first and second sets of user-selectable scheduling options comprises:

determining system availability to execute the respective unit of work; and  
determining the respective set of user-selectable scheduling options for repetitive execution of the unit of work on the basis of the respective cost and the system availability.

20. (Currently Amended) The computer readable storage medium of claim ~~[[33]]~~35, further comprising displaying the returned first and second sets of user-selectable scheduling options via a menu in the user interface.

21. (Currently Amended) The computer readable storage medium of claim ~~[[33]]~~35, further comprising determining the first and second sets of user-selectable scheduling options for future execution of the respective unit of work on the basis of the respective cost and at least one other factor selected from a user status and other queries already scheduled for execution by the user.

22. (Currently Amended) The computer readable storage medium of claim ~~[[33]]~~35, further comprising, for each of the first and second sets of user-selectable scheduling options:

receiving a user selection from the respective set of user-selectable scheduling options; and

storing a schedule for the respective unit of work on the basis of the user selection.

23. (Currently Amended) The computer readable storage medium of claim ~~[[33]]~~35, further comprising, for each of the first and second sets of user-selectable scheduling options:

receiving a user selection from the respective sets of user selectable scheduling options;

storing a schedule for the respective unit of work on the basis of the user selection; and

repetitively executing the respective unit of work on the basis of the schedule.

24. (Currently Amended) The computer readable storage medium of claim ~~[[33]]~~35, wherein determining the first and second costs to execute the respective unit of work comprises estimating a respective time required to execute the respective unit of work.

25. (Currently Amended) The computer readable storage medium of claim ~~[[33]]~~35, wherein determining the first and second costs to execute the respective units of work is done on the basis of historical query execution times for previous executions of the respective unit of work.

26-27. (Cancelled)

28. (Currently Amended) The computer system of claim ~~[[34]]~~37, further comprising a database against which the first and second units of work are executed.

29. (Currently Amended) The computer system of claim ~~[[34]]~~37, wherein at least one of the first and second units of work is a query.

30. (Currently Amended) The computer system of claim ~~[[34]]~~37, wherein at least one of the first and second units of work is an analysis routine.

31. (Currently Amended) A computer-implemented method for scheduling execution of units of work, comprising:

determining a first cost to execute a first unit of work;

determining a first set of user-selectable scheduling options for future execution of the first unit of work based on the first cost, wherein the first set of user-selectable scheduling options is a subset of a larger set of scheduling options, wherein the larger set of scheduling options are stored on a computer readable storage medium and include a plurality of user-selectable time criteria and frequency criteria, wherein the time criteria specifies when the execution of a given unit of work will begin and the frequency criteria specifies how frequently the given unit of work will be executed;

returning the first set of user-selectable scheduling options to a user interface for display, whereby the user interface presents:

time criteria selection elements from which a user specifies a time at which execution of the first unit of work will begin; and

frequency criteria selection elements from which the user specifies a frequency at which the first unit of work will be executed beginning at the specified time;

determining a second cost to execute a second unit of work;

determining a second set of user-selectable scheduling options for future execution of the second unit of work based on the second cost, wherein the second set of user-selectable scheduling options a subset of the larger set of scheduling options, and wherein the second set of user-selectable scheduling options is different than the first set of user-selectable scheduling options; and

returning the second set of user-selectable scheduling options to a user interface for display, whereby the user interface presents:

time criteria selection elements from which a user specifies a time at which execution of the second unit of work will begin; and

frequency criteria selection elements from which the user specifies a frequency at which the second unit of work will be executed beginning at the specified time.

32. (Previously Presented) The computer-implemented method of claim 31, wherein:

the first cost to execute the first unit of work is higher than the second cost to execute the second unit of work; and

the first set of user-selectable scheduling options is less than the second set of user-selectable scheduling options.

33. (Currently Amended) A computer-implemented method for scheduling units of work, comprising:

determining a first cost to execute a first unit of work;

determining system availability to execute the first unit of work;

determining a first set of user-selectable scheduling options for future execution of the first unit of work on the basis of the first cost and the system availability, wherein the first set of user-selectable scheduling options is a subset of a larger set of scheduling options, and wherein the larger set of scheduling options are stored on a computer readable storage medium and include a plurality of user-selectable time criteria and frequency criteria, wherein the time criteria specifies when the execution of a given unit of work will begin and the frequency criteria specifies how frequently the given unit of work will be executed;

returning the first set of user-selectable scheduling options to a user interface for display, whereby the user interface presents:

time criteria selection elements from which a user specifies a time at which execution of the first unit of work will begin; and

frequency criteria selection elements from which the user specifies a frequency at which the first unit of work will be executed beginning at the specified time;

determining a second cost to execute a second unit of work;

determining system availability to execute the second unit of work;  
determining a second set of user-selectable scheduling options for future execution of the second unit of work on the basis of the second cost and the system availability, wherein the first set of user-selectable scheduling options is a subset of the larger set of scheduling options, and wherein the second set of user-selectable scheduling options is different than the first set of user-selectable scheduling options;  
and  
returning the second set of user-selectable scheduling options to a user interface for display, whereby the user interface presents:  
time criteria selection elements from which a user specifies a time at which execution of the second unit of work will begin; and  
frequency criteria selection elements from which the user specifies a frequency at which the second unit of work will be executed beginning at the specified time.

34. (Previously Presented) The computer-implemented method of claim 33, wherein:

the first cost to execute the first unit of work is higher than the second cost to execute the second unit of work; and

the first set of user-selectable scheduling options is less than the second set of user-selectable scheduling options.

35. (Currently Amended) A computer readable storage medium containing a program which, when executed, performs an operation for scheduling execution of units of work, the operation comprising:

determining a first cost to execute a first unit of work;

determining a first set of user-selectable scheduling options for future execution of the first unit of work based on the first cost, wherein the first set of user-selectable scheduling options is a subset of a larger set of scheduling options, and wherein the larger set of scheduling options are stored on a computer readable storage medium and

include a plurality of user-selectable time criteria and frequency criteria, wherein the time criteria specifies when the execution of a given unit of work will begin and the frequency criteria specifies how frequently the given unit of work will be executed;

returning the first set of user-selectable scheduling options to a user interface for display, whereby the user interface presents:

time criteria selection elements from which a user specifies a time at which execution of the first unit of work will begin; and

frequency criteria selection elements from which the user specifies a frequency at which the first unit of work will be executed beginning at the specified time;

determining a second cost to execute a second unit of work;

determining a second set of user-selectable scheduling options for future execution of the second unit of work based on the second cost, wherein the second set of user-selectable scheduling options a subset of the larger set of scheduling options, and wherein the second set of user-selectable scheduling options is different than the first set of user-selectable scheduling options; and

returning the second set of user-selectable scheduling options to a user interface for display, whereby the user interface presents:

time criteria selection elements from which a user specifies a time at which execution of the second unit of work will begin; and

frequency criteria selection elements from which the user specifies a frequency at which the second unit of work will be executed beginning at the specified time.

36. (Previously Presented) The computer-readable storage medium of claim 35, wherein:

the first cost to execute the first unit of work is higher than the second cost to execute the second unit of work; and

the first set of user-selectable scheduling options is less than the second set of user-selectable scheduling options.

37. (Currently Amended) A computer system, comprising:
- a schedule indicating when units of work are to be executed;
  - a scheduler configured to:
    - determine a first cost to execute a first unit of work;
    - determine a first set of user-selectable scheduling options for repetitive execution of the first unit of work on the basis of the first cost, wherein the scheduler determines the first set of user-selectable scheduling options based on the first cost, wherein the first set of user-selectable scheduling options is a subset of a larger set of scheduling options, and wherein the larger set of scheduling options are stored on a computer readable storage medium and include a plurality of user-selectable time criteria and frequency criteria, wherein the time criteria specifies when the execution of a given unit of work will begin and the frequency criteria specifies how frequently the given unit of work will be executed;
    - return the first set of user-selectable scheduling unit of work to the user interface for display, whereby the user interface presents:
      - time criteria selection elements from which a user specifies a time at which execution of the first unit of work will begin; and
      - frequency criteria selection elements from which the user specifies a frequency at which the first unit of work will be executed beginning at the specified time;
    - determine a second cost to execute a second unit of work;
    - determine a second set of user-selectable scheduling options for repetitive execution of the second unit of work on the basis of the second cost, wherein the scheduler determines the second set of user-selectable scheduling options based on the second cost, wherein the second set of user-selectable scheduling options is a subset of the larger set of scheduling options, and wherein the second set of user-selectable scheduling options is different than the first set of user-selectable scheduling options; and

return the second set of user-selectable scheduling unit of work to the user interface for display, whereby the user interface presents:

time criteria selection elements from which a user specifies a time at which execution of the second unit of work will begin; and

frequency criteria selection elements from which the user specifies a frequency at which the second unit of work will be executed beginning at the specified time.

38. (Previously Presented) The computer system of claim 37, wherein:
- the first cost to execute the first unit of work is higher than the second cost to execute the second unit of work; and
- a number of scheduling options provided by the first set of user-selectable scheduling options is smaller than a number of scheduling options provided by the second set of user-selectable scheduling options.
